conDAQtor
Directing the lab orchestra

The problem

The home-written software that labs need to acquire data can limit the possibilities of the experiments. In addition, knowledge is not shared between PhD generations or research groups, resulting in a lack of continuity and time-consuming duplicated efforts.

My goal

Make research more efficient by offering support and training to researchers, while building a national network for knowledge transfer according to FAIR principles.

Expected results

Faster, more advanced experiments. Improved software reusability, and a strong network of labs that accumulate and share expertise.

How you can help the project

Provide feedback on the feasibility of the project, and support for the next steps towards realizing the project through a funded position.
